ADDANAPP · PARTNER BRIEFING

Apps built at AI speed. *Signed off by senior engineers.*

A Montréal development partner for consulting and software firms: fixed-price builds, human-validated AI, and code your clients own.

ADDANAPP IN NUMBERS

A studio that ships at *portfolio scale*

Most firms can show a few case studies. We can show fifty-one working products, and the toolchain that keeps all of them running.

51

products designed, built and shipped, from restaurant platforms to VR games

106

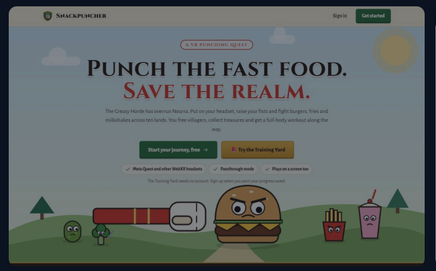

libraries, browser features and services catalogued across 57 projects

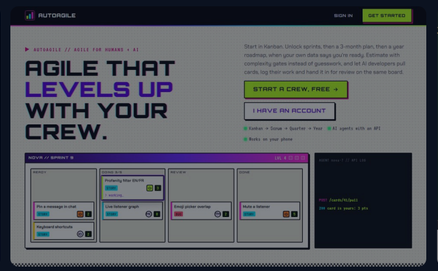

28

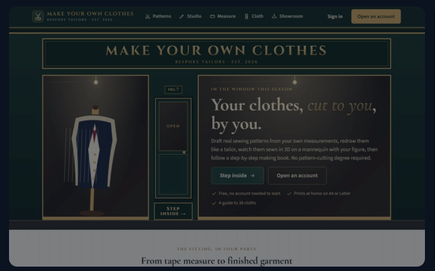

landing pages redesigned and pushed live in a single day

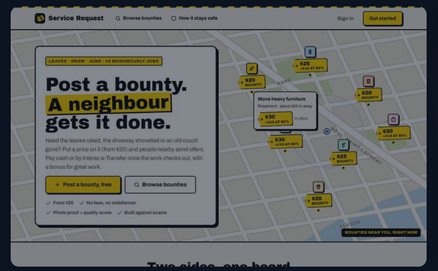

4

languages on our own client platform: English, French, Russian and Latvian

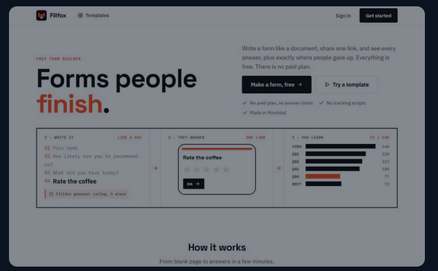

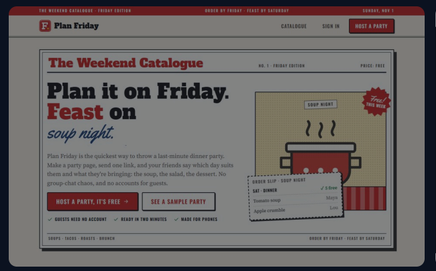

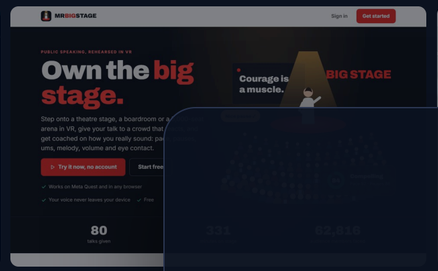

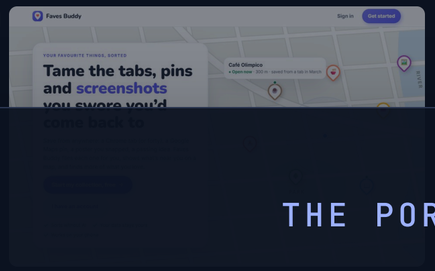

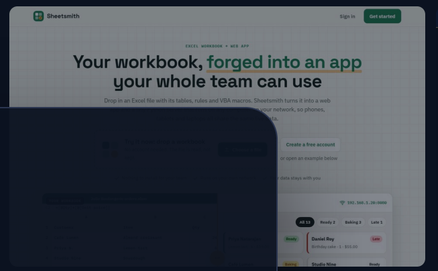

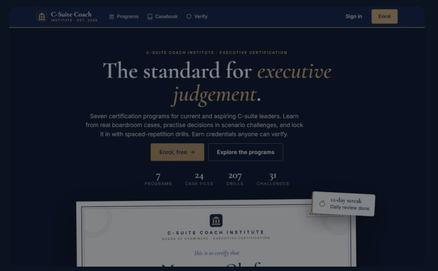

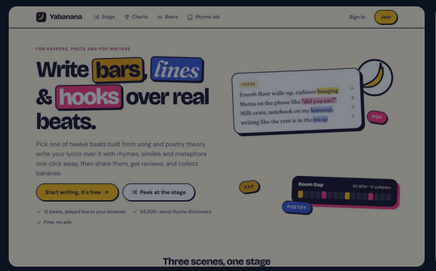

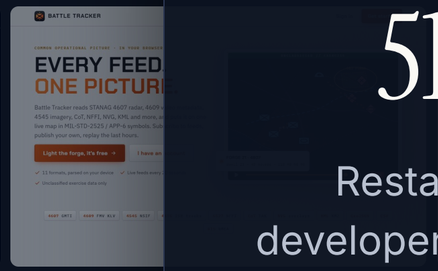

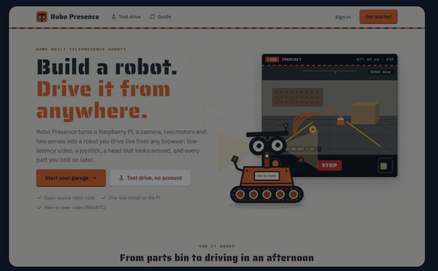

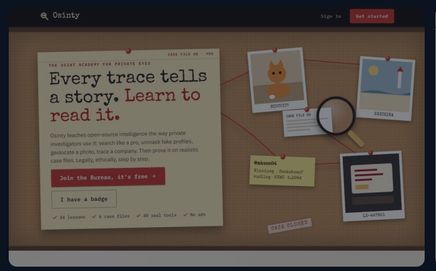

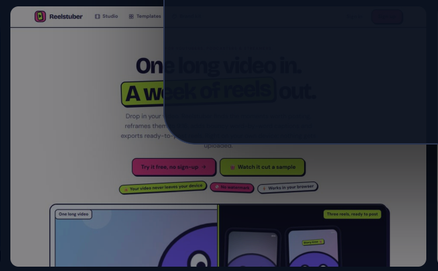

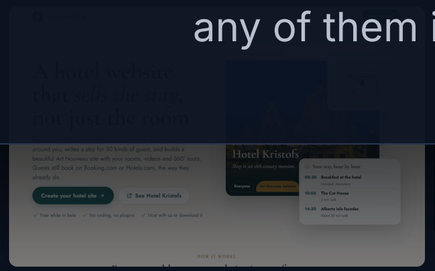

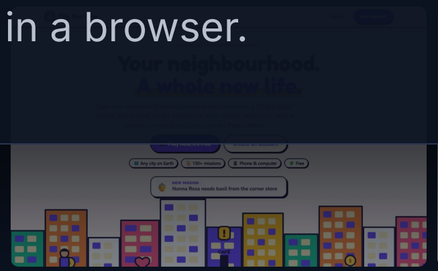

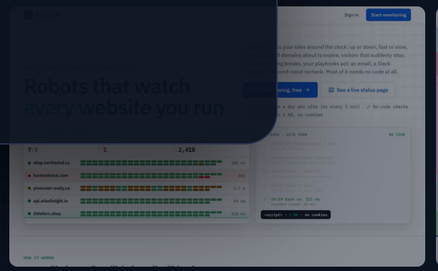

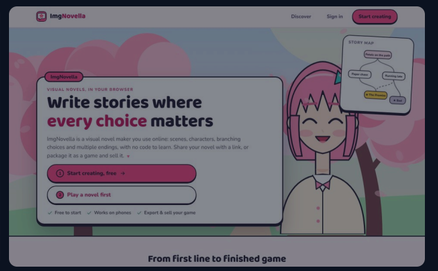

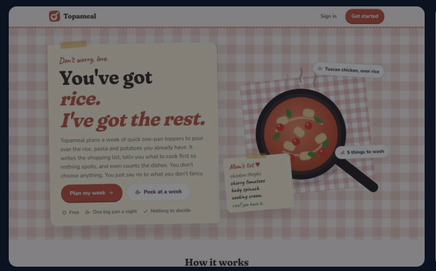

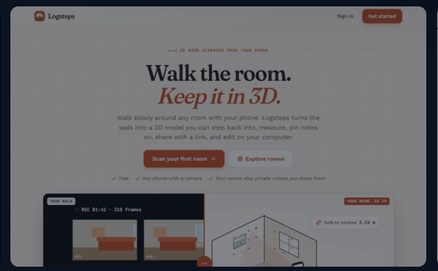

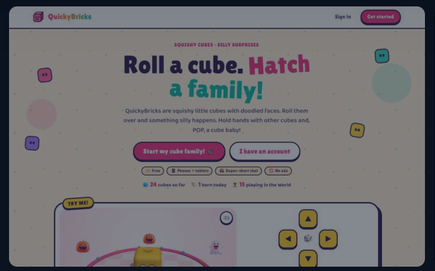

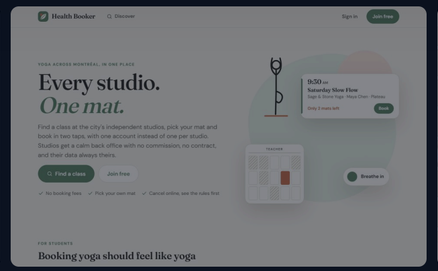

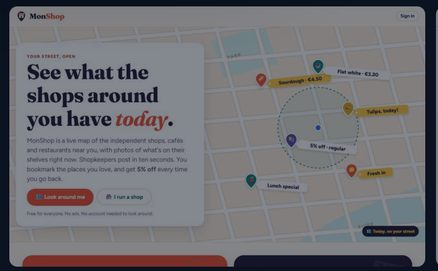

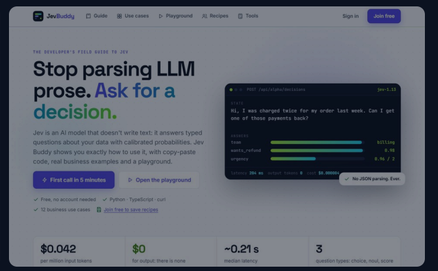

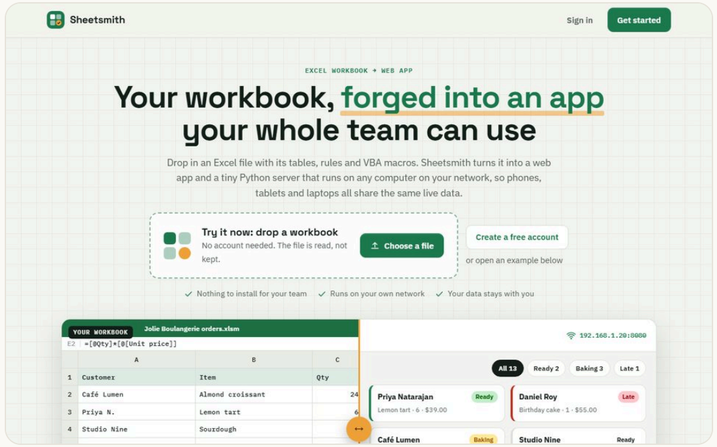

THE PORTFOLIO

51 products. *One studio.*

Restaurants, hotels, yoga studios, landlords, marketers, developers, gamers and VR headsets. Most are live today: open any of them in a browser.

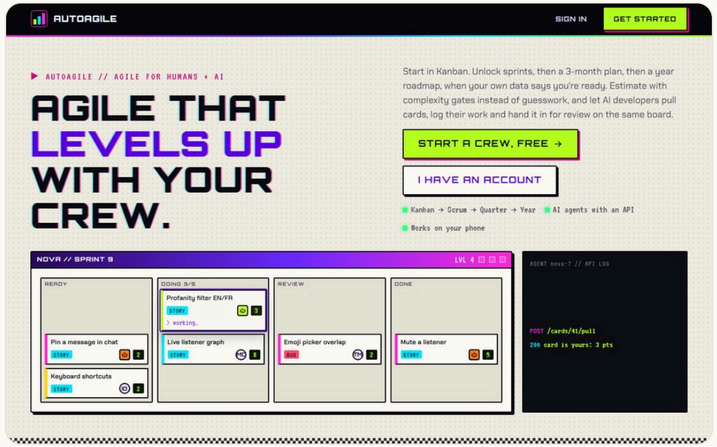

Modernizing how operations run

Sheetsmith

Turns an Excel workbook, VBA macros included, into a web app and a small Python server the whole team can use.

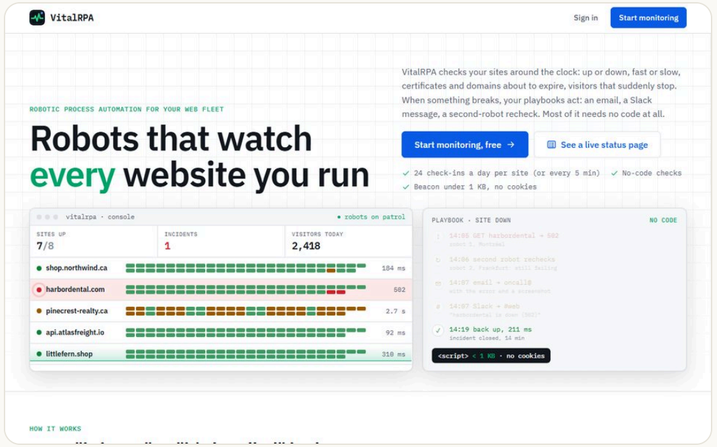

`Own formula + VBA runtime · Python`

AutoAgile

An agile board where people and AI agents share one backlog, with Jira import and live delivery reports.

`D3.js · Agent REST API · Jira import`

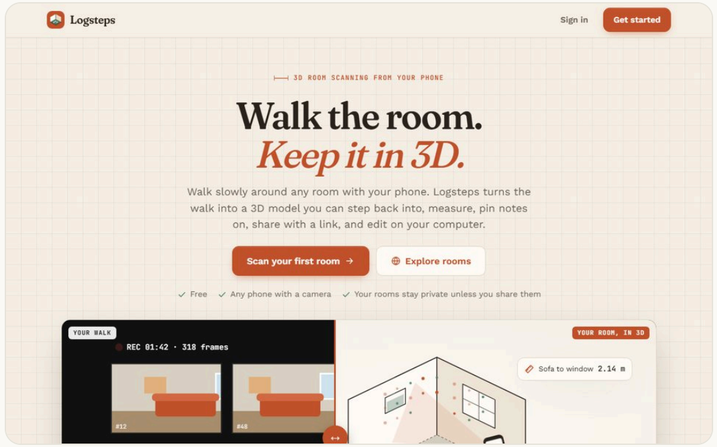

VitalRPA

Robots that check a fleet of websites around the clock and run playbooks the moment something breaks.

`Sub-1 KB beacon · Anvil HTTP · Email`

CAPABILITY 2 OF 4 · APPLIED AI

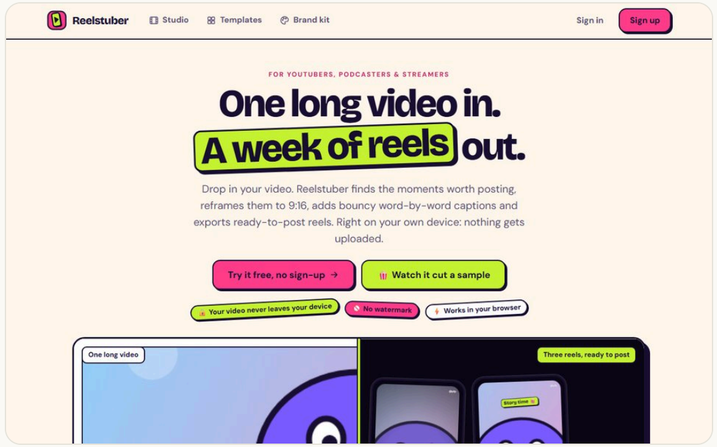

Putting AI inside the product

Logsteps

Walk a room with a phone. A reconstruction model rebuilds it in 3D so you can step back in and measure.

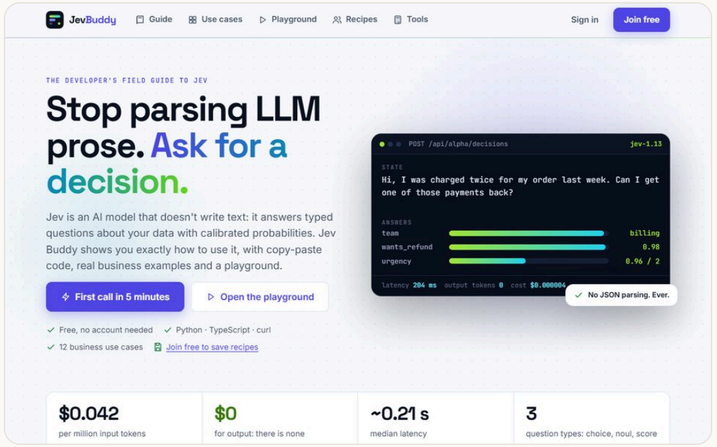

PyTorch · Open3D · three.js

Reelstuber

Finds the best moments in a long video and cuts captioned reels, entirely on the user's own device.

Transformers.js · Whisper · MediaPipe

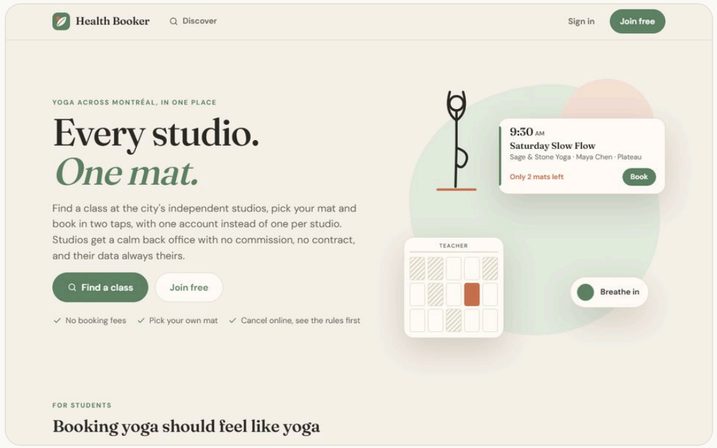

Jev Buddy

Developer guide and playground for an AI decision model, with an LLM helper capped per day and per person.

OpenRouter · Anvil Secrets

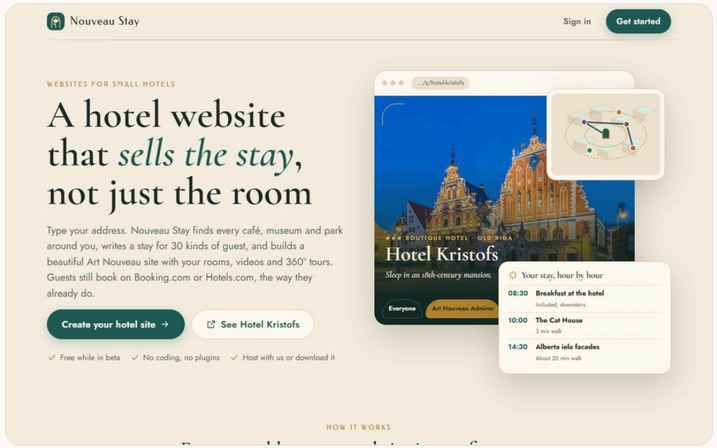

Running platforms with real customers

Health Booker

A marketplace for a city's yoga studios, plus a back office for each studio that runs its week.

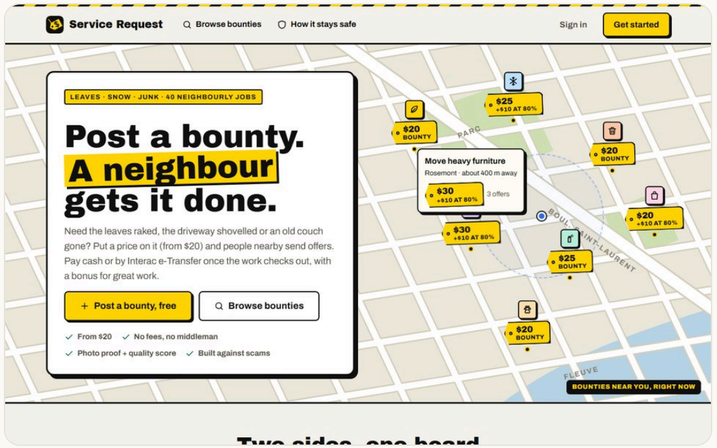

Multi-tenant · Roles · Anvil Users

ArviStay

Builds a hotel's whole website from its address: nearby sights, photos, map and stays. Made for a working hotel in Riga.

MapLibre · Overpass · Wikimedia

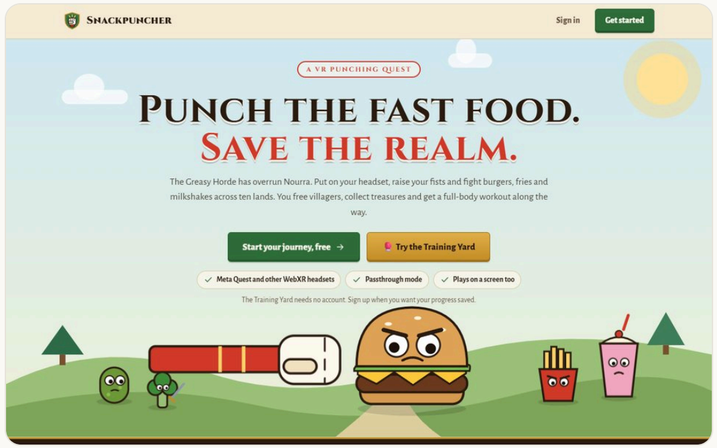

Service Request

A neighbourhood bounty board: post a job with a price, someone nearby does it, with photo proof and a quality bonus.

Leaflet · Nominatim · Geolocation

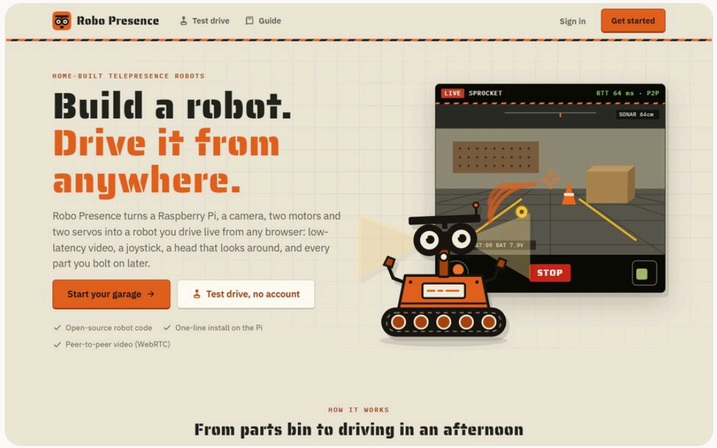

Shipping interfaces few teams have built

Snackpuncher

A VR fitness quest that runs straight in the Meta Quest browser. No app store, no install.

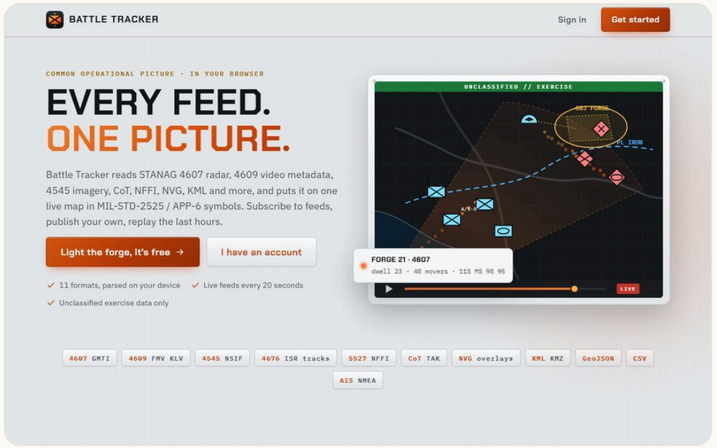

`three.js · WebXR · Web Audio`

Robo Presence

Drive a home-built robot from any browser, with live peer-to-peer video from a Raspberry Pi.

`WebRTC · aiortc · gpiozero`

Battle Tracker

Merges STANAG 4607 radar, CoT, KML and other feeds into one live map with standard unit symbols.

`Leaflet · milsymbol · Esri imagery`

THE METHOD

AI does the heavy lifting. *A human signs every step.*

AI drafts code, tests, migrations and documentation at a pace traditional teams can’t match. A senior engineer directs it, reviews every line and is accountable for what ships.

HOW EVERY REQUEST RUNS

Five steps from brief to accepted result

01

YOU

Brief

Describe the outcome in plain language. Screenshots and links welcome.

02

HUMAN

Scope and fixed quote

Acceptance criteria, risks, and a fixed price with an ETA. Nothing starts until you approve.

03

AI + ENGINEER

Accelerated build

AI agents draft code, tests, migrations and docs under an engineer's direction.

04

HUMAN

Validation

Line-by-line review, security and privacy checks, and tests against your criteria on real devices.

05

YOU

Accept, then pay

Try it on staging. Accept it, or ask for changes within scope at no extra cost. Then you're invoiced.

In the workspace, **AI drafts** and **human validations** are labelled apart, so you always know who stands behind each change.

OPERATIONS AT PORTFOLIO SCALE

Keeping 51 products healthy at once

ONE SOURCE

Legal kit

Privacy and Terms built from one source, installed on every app.

ONE SCRIPT

SEO kit

Titles, share images, sitemaps and robots files for every app.

DRIFT ALERTS

Schema check

Live database columns checked against the repo, on 50 apps.

ONE VIEW

App Board

Build, deploy, test and launch status for every app, side by side.

ALWAYS CURRENT

Library catalogue

Every library in every project, scanned and documented.

BEFORE DEPLOY

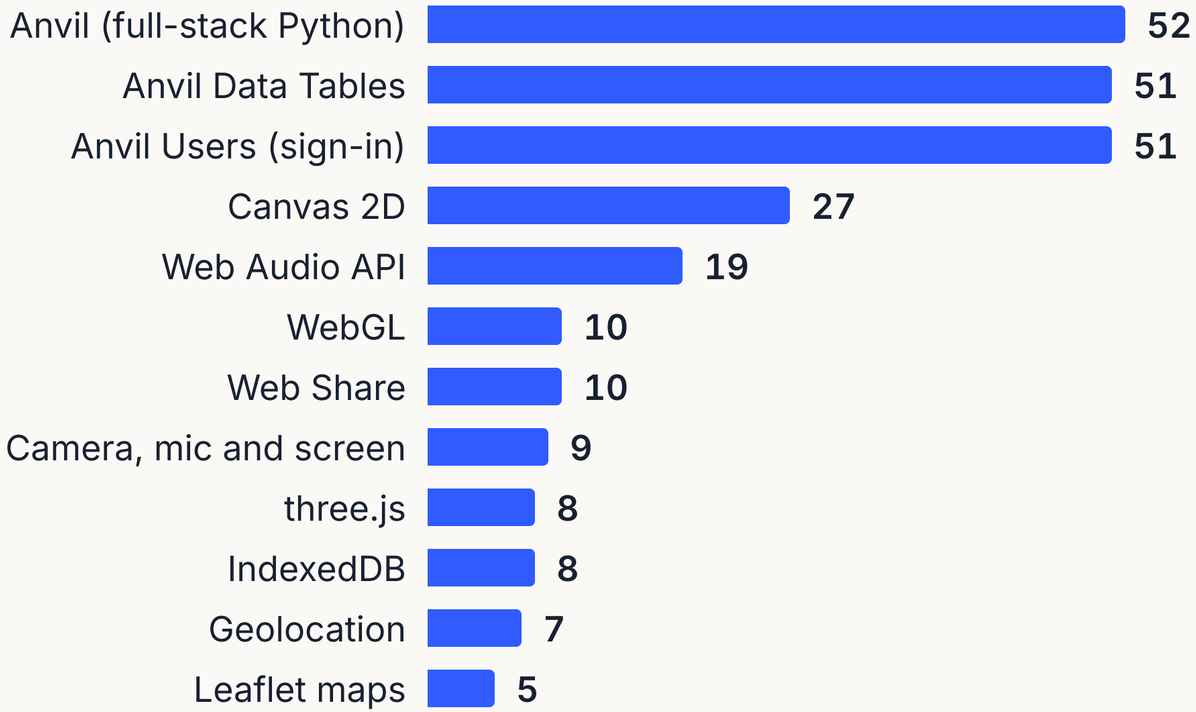

Preview and UI tests

Each app runs on a mock platform for tests and screenshots.

For a partner, the long tail of small client apps gets the same care as the flagship.

LIBRARIES · PROJECTS USING EACH, OF 57

The libraries we use most

One language, end to end

Full-stack Python on Anvil runs nearly every project: database, sign-in and server code in one codebase, on Postgres underneath.

The browser as the platform

Canvas, audio, WebGL, camera and storage APIs do the work that once needed plugins or an app-store install.

Source: Addanapp library catalogue, 57 projects scanned, 1 Nov 2026

COMPLEX AND IMPORTANT · 1 OF 2

Complex libraries: AI, vision and data

Transformers.js + Whisper

Speech-to-text inside the browser. The model downloads once; audio never leaves the device.

`Reelstuber · VideoBlog Buddy`

MediaPipe vision

Real-time hand tracking, 21 points per hand, and person cut-outs from a webcam feed.

`Subsudo · Reelstuber`

PyTorch + Open3D

A reconstruction model turns a walk of phone frames into a cleaned, measurable 3D mesh.

`Logsteps`

Tesseract.js

OCR compiled to WebAssembly: reads posters, menus and screenshots on the device.

`Faves Buddy`

D3.js

Burndown, burnup, cumulative flow and cycle-time reports, drawn exactly as designed.

`AutoAgile`

Claude API, OpenRouter

LLM features with keys kept server-side and per-person daily caps, or the user’s own key.

`Hookline · Jev Buddy`

COMPLEX AND IMPORTANT · 2 OF 2

Complex libraries: 3D, real time and hardware

three.js + WebGL

3D scenes, from VR arenas to a cloth simulation that sews a pattern onto a mannequin.

8 projects, incl. MrBigStage

WebXR

VR and passthrough AR in the Meta Quest browser, with no app store and no install.

Snackpuncher · WallTracer

WebRTC, PeerJS, aiortc

Live peer-to-peer video and data between browsers, and between a browser and a robot.

Mafia Camp · Robo Presence

Raspberry Pi stack

gpiozero, picamera2, PyAV and pyserial drive motors, servos, sonar, camera and an Arduino.

Robo Presence

MapLibre + OSM

Styled vector maps, address search and “every café within 500 m” queries via Overpass.

ArviStay · Faves Buddy

Forge, Chrome MV3

Apps that live inside Jira and inside the browser itself, right next to the user’s work.

Redline for Jira · Faves Buddy

STACK AND HOSTING

Code you own, running *where you need it*

01 · YOUR REPO

A Git repository from day one

Full-stack Python with plain HTML, CSS and JavaScript. No proprietary front-end framework to unlearn.

02 · CHECKED

Tested before every deploy

Automated checks, UI tests on a local preview, and an engineer’s sign-off on every change.

03 · DEPLOYED

Hosted where you choose

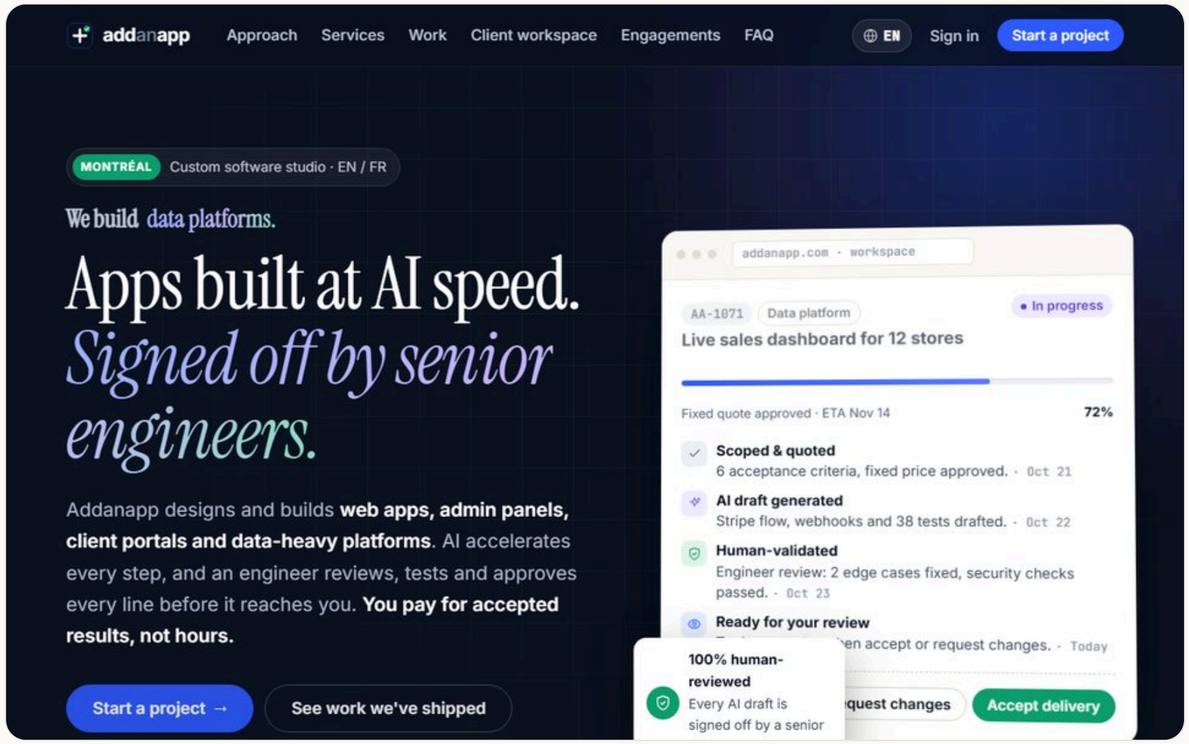

Managed Anvil hosting, or the open-source Anvil App Server in Docker on your own cloud.

RUNS ON ANY LINUX SERVER OR CONTAINER PLATFORM

- Managed Anvil cloud
- Microsoft Azure
- AWS or Google Cloud
- On-premises Linux
- Canadian hosting on request

PARTNER VISIBILITY

Every request visible, from quote to delivery

- **Submitted**
  Brief in plain language
- **Scoping**
  Criteria and risks written down
- **Quote ready**
  Fixed price and ETA to approve
- **In progress**
  Notes from the engineer doing the work
- **Ready for review**
  Try it on staging
- **Delivered**
  Accepted, then invoiced

ENGAGEMENT MODELS

Four ways to partner

FOR PURSUITS

Pursuit prototypes

A working prototype for a bid or discovery workshop, so your client sees the solution before the SOW.

`Fixed quote · your brand`

FOR DELIVERY

Overflow delivery

Well-scoped modules such as admin panels, portals and integrations, built to your standards and QA gates.

`Fixed quote per module`

FOR AI TEAMS

The app around your model

Portals, review queues and dashboards that put a model or data product in front of real users.

`Fixed-price milestones`

ONGOING

Reserved capacity

A senior engineer with AI leverage on your roadmap and a priority queue. Pause or stop any month.

`Monthly capacity`

Every engagement runs through the shared workspace, with fixed quotes and acceptance-based billing.

COMMITMENTS

What every partner can count on

You own everything	Code, data and accounts belong to you or your client from day one. No lock-in.
No acceptance, no invoice	You pay for results that have been tested and approved.
Human-validated	No AI output ships without a senior engineer’s sign-off.
Privacy by design	Built with Québec’s Law 25 and PIPEDA in mind. Canadian hosting on request.
English and français	Bilingual service from Montréal, in person or remote.

NEXT STEP

Start with one fixed-price pilot

1

Pick one item

A pursuit prototype, a backlog module or the internal tool nobody has had time to build.

2

Get a fixed quote

Acceptance criteria, price and ETA from an engineer within two business days.

3

Accept, then pay

Try it on staging. If it misses the criteria, we fix it at no extra cost.

Suggested first conversation: 30 minutes to choose the pilot and agree how we plug into your delivery process.

LET’S TALK

Bring us the brief. *We’ll bring the build.*

Vitalijs Arkulinskis, Founder
